

Programming Languages

Datatypes

Review so far

Many kinds of expressions:

1. Simple
2. Variables
3. Functions

Review so far

- We've seen some **base** types and values:
 - Integers, Floats, Bool, String etc.
- Some ways to **build** up types:
 - Products (tuples), records, “lists”
 - Functions
- Design Principle: **Orthogonality**
 - Don't clutter **core language** with stuff
 - Few, powerful orthogonal building techniques
 - Put “**derived**” types, values, functions in **libraries**

Next: Building datatypes

Three key ways to build complex types/values

1. “Each-of” types

Value of T contains value of T1 **and** a value of T2

2. “One-of” types

Value of T contains value of T1 **or** a value of T2

3. “Recursive”

Value of T contains (sub)-value of **same type** T

Next: Building datatypes

Three key ways to build complex types/values

1. “Each-of” types **(T1 * T2)**

Value of T contains value of T1 **and** a value of T2

2. “One-of” types

Value of T contains value of T1 **or** a value of T2

3. “Recursive”

Value of T contains (sub)-value of **same type** T

Suppose I wanted ...

... a program that processed lists of attributes

- Name (string)
- Age (integer)
- ...

Suppose I wanted ...

... a program that processed lists of attributes

- Name (string)
- Age (integer)
- DOB (int-int-int)
- Address (string)
- Height (float)
- Alive (boolean)
- Phone (int-int)
- email (string)

Many kinds of attributes (too many to put in a record)

- can have multiple names, addresses, phones, emails etc.

Want to store them in a **list**. Can I ?

Constructing Datatypes

```
type t = C1 of t1 | C2 of t2 | ... | Cn of tn
```

t is a new datatype.

A value of type t is either:

a value of type $t1$ placed in a box labeled $C1$

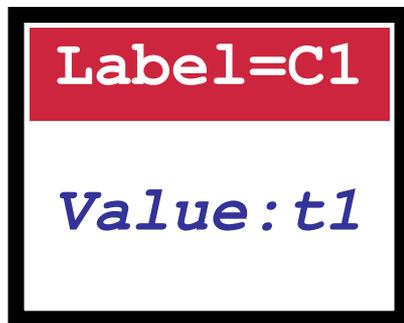

Or a value of type $t2$ placed in a box labeled $C2$

Or ...

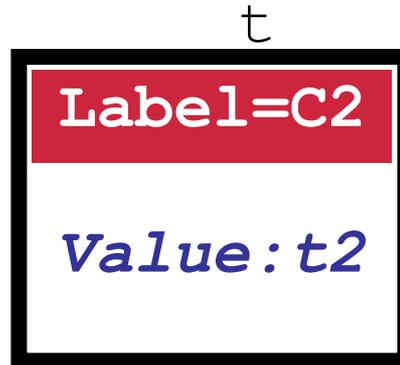

Or a value of type tn placed in a box labeled Cn

Constructing Datatypes

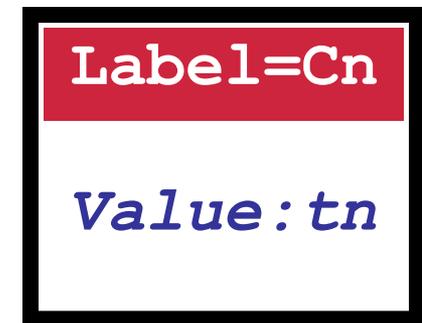

```
type t = C1 of t1 | C2 of t2 | ... | Cn of tn
```

OR

OR

All have the type **t**

Suppose I wanted ...

Attributes:

- Name (string)
- Age (integer)
- DOB (int-int-int)
- Address (string)
- Height (real)
- Alive (boolean)
- Phone (int-int)
- email (string)

```
type attrib =  
    Name of string  
| Age of int  
| DOB of int*int*int  
| Address of string  
| Height of float  
| Alive of bool  
| Phone of int*int  
| Email of string;;
```

How to PUT values into box?

How to PUT values into box?

How to create values of type `attrib` ?

```
# let a1 = Name "Bob";;
val x : attrib = Name "Bob"
# let a2 = Height 5.83;;
val a2 : attrib = Height 5.83
# let year = 1977 ;;
val year : int = 1977
# let a3 = DOB (9,8,year) ;;
val a3 : attrib = DOB (9,8,1977)
# let a_l = [a1;a2;a3];;
val a3 : attrib list = ...
```

```
type attrib =
  Name of string
| Age of int
| DOB of int*int*int
| Address of string
| Height of float
| Alive of bool
| Phone of int*int
| Email of string;;
```

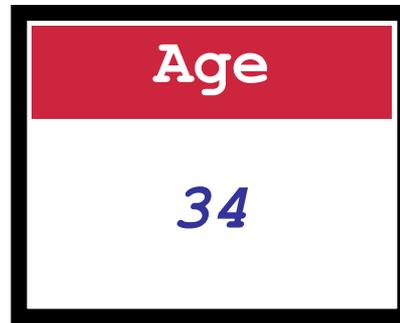

Constructing Datatypes

```
type attrib
```

```
= Name of string      | Age of int          | DOB of int*int*int  
| Address of string   | Height of float    | Alive of bool  
| Phone of int*int    | Email of string;;
```

OR

OR

```
Name "Bob"
```

```
Age 34
```

```
DOB (9, 8, 77)
```

All have type **attrib**

One-of types

- We've defined a “one-of” type named `attrib`
- Elements are **one of**:
 - `string`,
 - `int`,
 - `int*int*int`,
 - `float`,
 - `bool ...`

```
datatype attrib =  
  Name of string  
| Age of int  
| DOB of int*int*int  
| Address of string  
| Height of real  
| Alive of bool  
| Phone of int*int  
| Email of string;
```

- Can create uniform `attrib` lists
- Say I want a function to print attribs...

How to TEST & TAKE whats in box?

Is it a ...

`string?`

or an

`int?`

or an

`int*int*int?`

or ...

How to TEST & TAKE whats in box?

Look at TAG!

How to tell whats in the box ?

```
match e with
| Name s      -> printf "%s" s
| Age i       -> printf "%d" i
| DOB (d,m,y) -> printf "%d/%d/%d" d m y
| Address s   -> printf "%s" s
| Height h    -> printf "%f" h
| Alive b     -> printf "%b" b
| Phone (a,r) -> printf "(%d)-%d" a r
```

Pattern-match expression: check if e is of the form ...

- On match:
 - value in box bound to pattern variable
 - matching result expression is evaluated
- Simultaneously test and extract contents of box

How to tell whats in the box ?

```
type attrib =
```

```
  Name of string  
| Age of int  
| DOB of int*int*int  
| Address of string  
| Height of float  
| Alive of bool  
| Phone of int*int
```

```
match e with
```

```
| Name s      -> ... (*s: string *)  
| Age i       -> ... (*i: int *)  
| DOB (d,m,y) -> ... (*d: int,m: int,y: int*)  
| Address a  -> ... (*a: string*)  
| Height h   -> ... (*h: int *)  
| Alive b    -> ... (*b: bool*)  
| Phone (a,r) -> ... (*a: int, r: int*)
```

Pattern-match expression: check if e is of the form ...

- On match:
 - value in box bound to pattern variable
 - matching result expression is evaluated
- Simultaneously test and extract contents of box

How to tell whats in the box

```
# match (Name "Bob") with
| Name s -> printf "Hello %s\n" s
| Age i  -> printf "%d years old" i
;;
Hello Bob
- : unit = ()
```

None of the cases matched the tag (Name)
Causes nasty *Run-Time Error*

How to TEST & TAKE whats in box?

BEWARE!!
Be sure to
handle all
TAGS!

Beware! Handle All TAGS!

```
# match (Name "Bob") with
| Age i   -> Printf.printf "%d" i
| Email s -> Printf.printf "%s" s
;;
```

Exception: Match Failure!!

None of the cases matched the tag (Name)
Causes nasty *Run-Time Error*

Compiler to the Rescue!

```
# match (Name "Bob") with
| Age i    -> Printf.printf "%d" i
| Email s  -> Printf.printf "%s" s
;;
```

Exception: Match Failure!!

None of the cases matched the tag (Name)
Causes nasty *Run-Time Error*

Compiler To The Rescue!!

```
# let printAttrib a = match a with
  | Name s -> Printf.printf "%s" s
  | Age i  -> Printf.printf "%d" I
  | DOB (d,m,y) -> Printf.printf "%d / %d / %d" d m y
  | Address addr -> Printf.printf "%s" addr
  | Height h -> Printf.printf "%f" h
  | Alive b -> Printf.printf "%b" b
  | Email e -> Printf.printf "%s" e
;;
```

Warning P: this pattern-matching is not exhaustive. Here is an example of a value that is not matched: Phone (_, _)

Compile-time checks for:

missed cases: ML warns if you miss a case!

Compiler To The Rescue!!

```
# let printAttrib a = match a with
  | Name s -> Printf.printf "%s" s
  | Age i  -> Printf.printf "%d" I
  | DOB (d,m,y) -> Printf.printf "%d / %d / %d" d m y
  ...
  | Age i -> Printf.printf "%d" i ;;
Warning U: this match case is unused.
```

Compile-time checks for:

redundant cases: ML warns if a case **never matches**

Another Few Examples

```
# let printAttrib a = match a with
  | Name s -> Printf.printf "%s" s
  | Age i  -> Printf.printf "%d" I
  | DOB (d,m,y) -> Printf.printf "%d / %d / %d" d m y
  ...
  | Age i -> Printf.printf "%d" i ;;
Warning U: this match case is unused.
```

See code text file

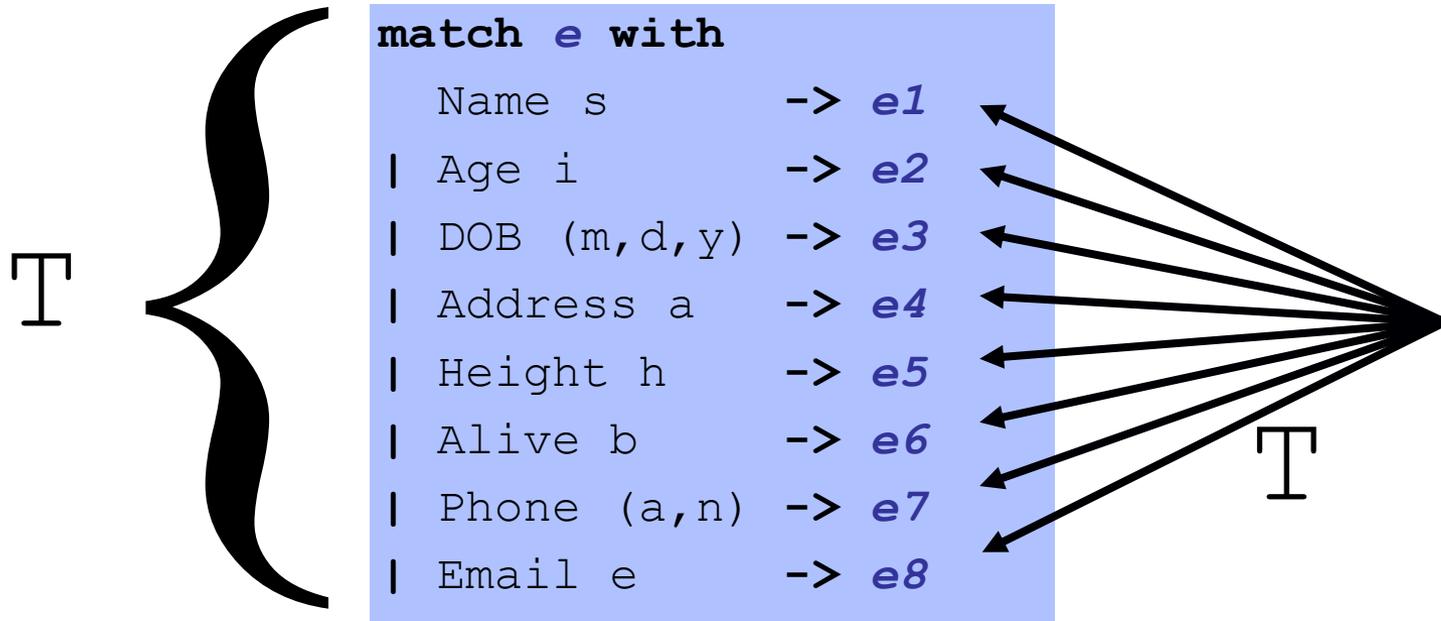

match-with is an Expression

```
match e with
  C1 x1 -> e1
| C2 x2 -> e2
| ...
| Cn xn -> en
```

Type Rule

- e_1, e_2, \dots, e_n must have same type \mathbb{T}
- Type of whole expression is \mathbb{T}

match-with is an Expression

Type Rule

- e_1, e_2, \dots, e_n must have same type T
- Type of whole expression is T

Benefits of `match-with`

```
match e with
  C1 x1 -> e1
| C2 x2 -> e2
| ...
| Cn xn -> en
```

```
type t =
  C1 of t1
| C2 of t2
| ...
| Cn of tn
```

1. Simultaneous `test-extract-bind`
2. Compile-time checks for:
 - `missed` cases: ML warns if you miss a `t` value
 - `redundant` cases: ML warns if a case never matches

Next: Building datatypes

Three key ways to build complex types/values

1. “Each-of” types **t1 * t2**

Value of T contains value of T1 **and** a value of T2

2. “One-of” types **type t = C1 of t1 | C2 of t2**

Value of T contains value of T1 **or** a value of T2

3. “Recursive” type

Value of T contains (sub)-value of **same type T**

“Recursive” types

```
type nat = Zero | Succ of nat
```

“Recursive” types

```
type nat = Zero | Succ of nat
```

Wait a minute! **Zero** of what ?!

“Recursive” types

```
type nat = Zero | Succ of nat
```

Wait a minute! **Zero** of what ?!

Relax.

Means “empty box with label **Zero**”

“Recursive” types

```
type nat = Zero | Succ of nat
```

What are values of `nat` ?

“Recursive” types

```
type nat = Zero | Succ of nat
```

What are values of `nat` ?

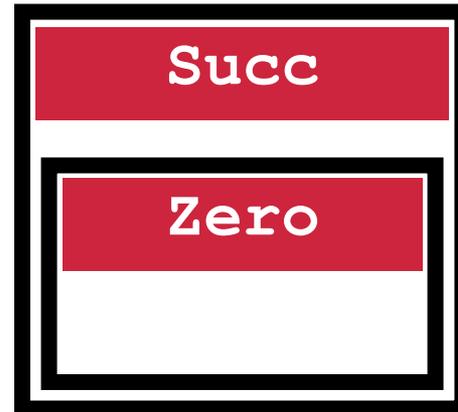

Zero

“Recursive” types

```
type nat = Zero | Succ of nat
```

What are values of `nat` ?

One `nat` contains another!

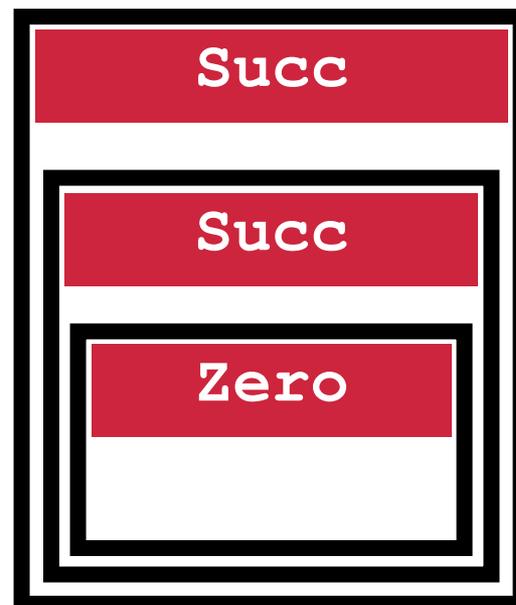

“Recursive” types

```
type nat = Zero | Succ of nat
```

What are values of `nat` ?

One `nat` contains another!

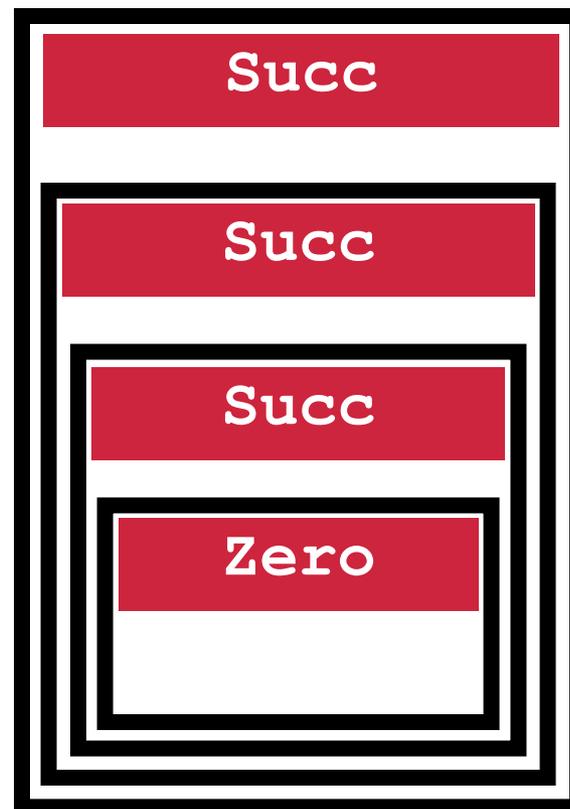

“Recursive” types

```
type nat = Zero | Succ of nat
```

What are values of `nat` ?

One `nat` contains another!

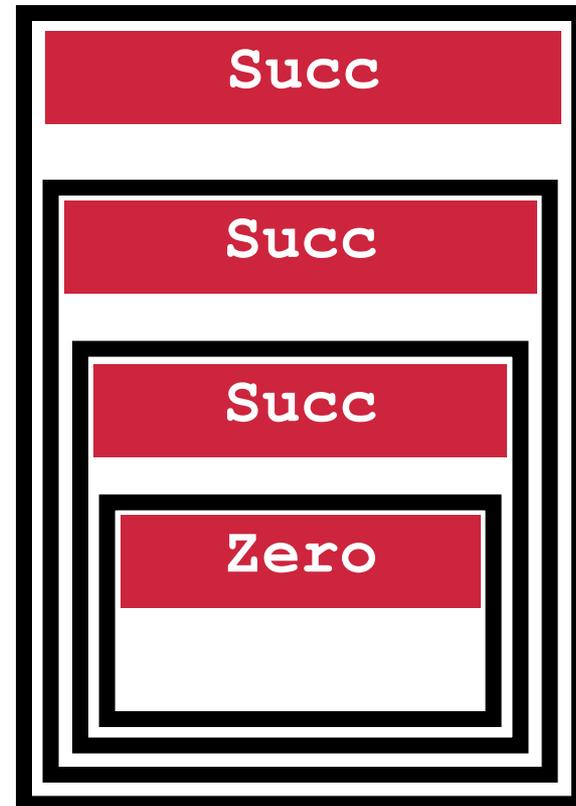

“Recursive” types

```
type nat = Zero | Succ of nat
```

What are values of `nat` ?
One `nat` contains another!

`nat` = recursive type

Next: Building datatypes

Three key ways to build complex types/values

1. “Each-of” types **t1 * t2**

Value of T contains value of T1 **and** a value of T2

2. “One-of” types **type t = C1 of t1 | C2 of t2**

Value of T contains value of T1 **or** a value of T2

3. “Recursive” type **type t = ... | C of (...*t)**

Value of T contains (sub)-value of **same type T**

Inductive pattern | **Succ m'** -> **plus n (times n m')**

Inductive Expression

Next: Lets get cosy with Recursion

Recursive Code Mirrors Recursive Data

Lists are recursive types!

```
type int_list =  
  Nil  
| Cons of int * int_list
```

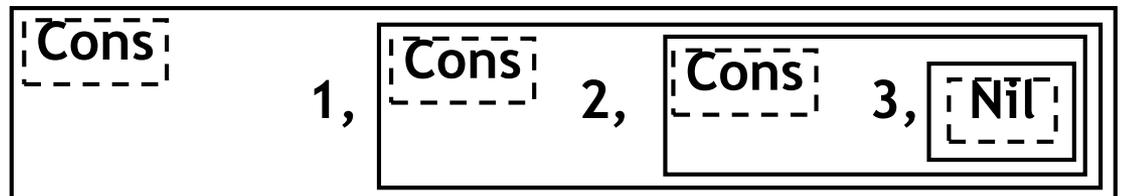

Think about this! What are values of `int_list` ?

`Cons(1,Cons(2,Cons(3,Nil)))`

`Cons(2,Cons(3,Nil))`

`Cons(3,Nil)`

`Nil`

Lists aren't built-in !

```
datatype int_list =  
  Nil  
| Cons of int * int_list
```

Lists are a **derived** type: built using elegant core!

1. Each-of
2. One-of
3. Recursive

`::` is just a pretty way to say “Cons”

`[]` is just a pretty way to say “Nil”

Some functions on Lists : Length

```
let rec len l =  
  match l with  
  | Nil -> 0  
  | Cons(h,t) -> 1 + (len t)
```

Base pattern | Nil -> 0 *Base Expression*

Inductive pattern | Cons(h,t) -> 1 + (len t) *Inductive Expression*

```
let rec len l =  
  match l with  
  | Nil -> 0  
  | Cons(_,t) -> 1 + (len t)
```

No binding for head

```
let rec len l =  
  match l with  
  | Cons(_,t) -> 1 + (len t)  
  | _ -> 0
```

Pattern-matching in order

Some functions on Lists : Append

```
let rec append (l1,l2) =
```

- Find the right **induction** strategy
 - **Base** case: pattern + expression
 - **Induction** case: pattern + expression

Well designed datatype gives strategy

Some functions on Lists : Max

```
let rec max xs =
```

- Find the right **induction** strategy
 - **Base** case: pattern + expression
 - **Induction** case: pattern + expression

Well designed datatype gives strategy

null, hd, tl are all functions ...

Bad ML style: More than aesthetics !

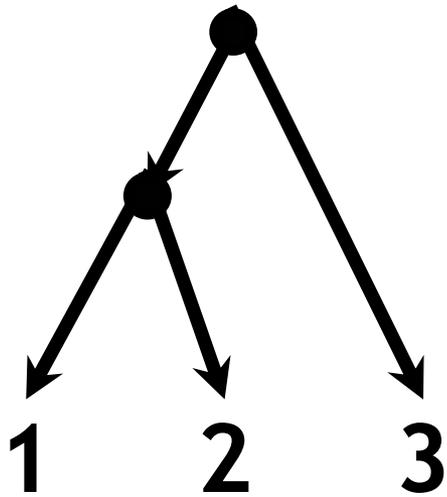

Pattern-matching better than test-extract:

- ML checks **all cases covered**
- ML checks **no redundant cases**
- ...at **compile-time**:
 - fewer errors (crashes) during execution
 - get the bugs out ASAP!

Next: Lets get cosy with Recursion

Recursive Code Mirrors Recursive Data

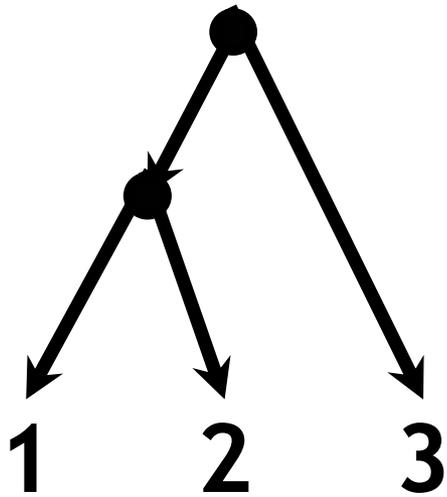

Representing Trees

```
type tree =  
| Leaf of int  
| Node of tree*tree
```

Leaf 1

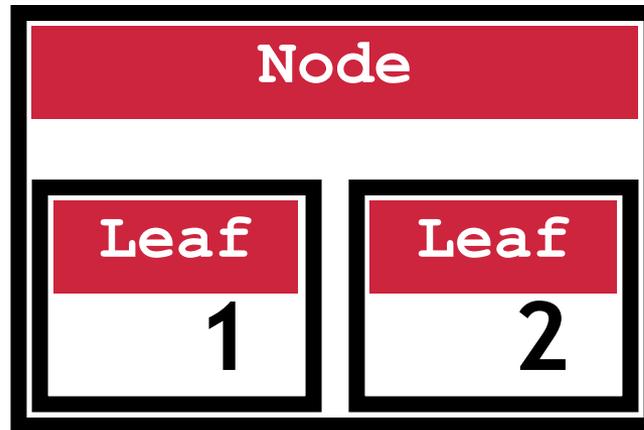

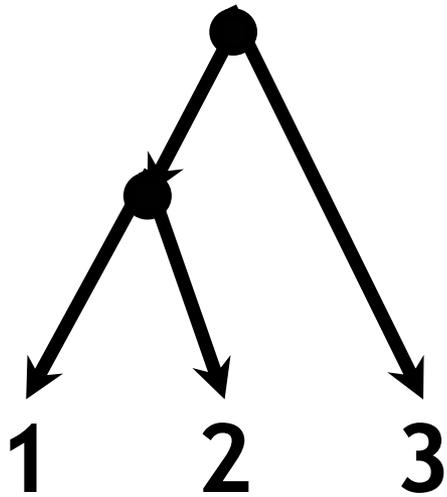

Representing Trees

```
type tree =  
| Leaf of int  
| Node of tree*tree
```

Leaf 2

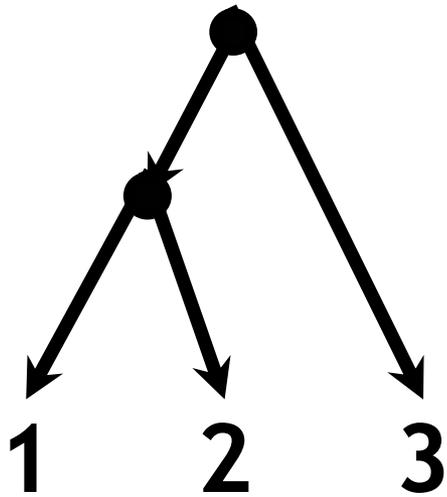

Representing Trees

```
type tree =  
| Leaf of int  
| Node of tree*tree
```

Node(Leaf 1, Leaf 2)

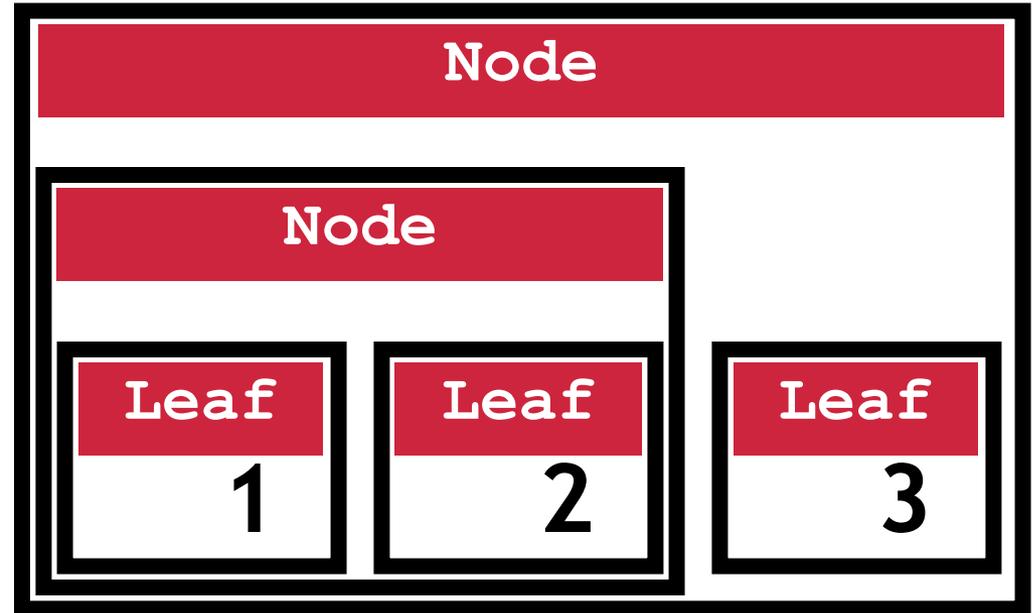

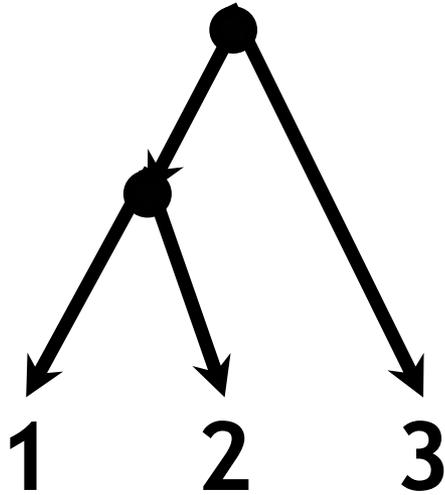

Representing Trees

```
type tree =  
| Leaf of int  
| Node of tree*tree
```

Leaf 3

Representing Trees

```
type tree =  
| Leaf of int  
| Node of tree*tree
```

Node(Node(Leaf 1, Leaf 2), Leaf 3)

Next: Lets get cosy with Recursion

Recursive Code Mirrors Recursive Data

sum_leaf: tree -> int

“Sum up the leaf values”. E.g.

```
# let t0 = Node(Node(Leaf 1, Leaf 2), Leaf 3);;  
- : int = 6
```

`sum_leaf: tree -> int`

```
type tree =  
| Leaf of int  
| Node of tree*tree
```

```
let rec sum_leaf t =
```

sum_leaf: tree -> int

```
type tree =
```

Base pattern | **Leaf** of int

Inductive pattern | **Node** of tree*tree

```
let rec sum_leaf t =
```

sum_leaf: tree -> int

```
type tree =
```

Base pattern | Leaf of int

Inductive pattern | Node of tree*tree

```
let rec sum_leaf t =
```

```
match t with
```

Base pattern | Leaf n ->

Inductive pattern | Node (t1, t2) ->

sum_leaf: tree -> int

```
type tree =
```

Base pattern | Leaf of int

Inductive pattern | Node of tree*tree

```
let rec sum_leaf t =
```

```
match t with
```

Base pattern | Leaf n -> n *Base Expression*

Inductive pattern | Node (t1, t2) -> sum_leaf t1 + sum_leaf t2

Inductive Expression

Recursive Code Mirrors Recursive Data

Code almost writes itself!

Another Example: Calculator

Want an arithmetic calculator to evaluate expressions like:

- $4.0 + 2.9$
- $3.78 - 5.92$
- $(4.0 + 2.9) * (3.78 - 5.92)$

Another Example: Calculator

Want an arithmetic calculator to evaluate expressions like:

- $4.0 + 2.9 \implies 6.9$
- $3.78 - 5.92 \implies -2.14$
- $(4.0 + 2.9) * (3.78 - 5.92) \implies -14.766$

Whats a ML **TYPE** for **REPRESENTING** expressions ?

Another Example: Calculator

Want an arithmetic calculator to evaluate expressions like:

- $4.0 + 2.9 \implies 6.9$
- $3.78 - 5.92 \implies -2.14$
- $(4.0 + 2.9) * (3.78 - 5.92) \implies -14.766$

Whats a ML **TYPE** for **REPRESENTING** expressions ?

```
type expr =  
| Num of float  
| Add of expr*expr  
| Sub of expr*expr  
| Mul of expr*expr
```

Another Example: Calculator

Want an arithmetic calculator to evaluate expressions like:

- $4.0 + 2.9 \implies 6.9$
- $3.78 - 5.92 \implies -2.14$
- $(4.0 + 2.9) * (3.78 - 5.92) \implies -14.766$

Whats a ML **FUNCTION** for **EVALUATING** expressions ?

```
type expr =  
| Num of float  
| Add of expr*expr  
| Sub of expr*expr  
| Mul of expr*expr
```

Another Example: Calculator

Want an arithmetic calculator to evaluate expressions like:

- $4.0 + 2.9 \implies 6.9$
- $3.78 - 5.92 \implies -2.14$
- $(4.0 + 2.9) * (3.78 - 5.92) \implies -14.766$

Whats a ML **FUNCTION** for **EVALUATING** expressions ?

```
type expr =  
| Num of float  
| Add of expr*expr  
| Sub of expr*expr  
| Mul of expr*expr
```

```
let rec eval e = match e with  
| Num f      ->  
| Add (e1, e2) ->  
| Sub (e1, e2) ->  
| Mul (e1, e2) ->
```

Another Example: Calculator

Want an arithmetic calculator to evaluate expressions like:

- $4.0 + 2.9 \implies 6.9$
- $3.78 - 5.92 \implies -2.14$
- $(4.0 + 2.9) * (3.78 - 5.92) \implies -14.766$

Whats a ML **FUNCTION** for **EVALUATING** expressions ?

```
type expr =  
| Num of float  
| Add of expr*expr  
| Sub of expr*expr  
| Mul of expr*expr
```

```
let rec eval e = match e with  
| Num f      -> f  
| Add (e1,e2) -> eval e1 +. eval e2  
| Sub (e1,e2) -> eval e1 -. eval e2  
| Mul (e1,e2) -> eval e1 *. eval e2
```
