

Tour of common optimizations

How excited are you about this course?

- A. Super excited
- B. A little excited
- C. Not that excited
- D. Not at all excited

How nervous are you about this course?

- A. Super nervous
- B. A little nervous
- C. Not that nervous
- D. Not at all nervous

What is your primary reason for 231?

- A. I'm doing research and compilers and related areas, so I want to learn about compilers
- B. I'm not doing research in this area, but still want to learn about compilers
- C. A friend recommended it
- D. I want to only take AI and Machine learning courses, but the program requires me to take other classes too, so here I am. Ugh
- E. Other

Simple example

```
foo(z) {  
  
    x := 3 + 6;  
  
    y := x - 5  
  
    return z * y  
  
}
```

Simple example

```
foo(z) {  
    x := 3 + 6; g  
    Cant prop (CP) g  
    y := x - 5 4 (CF)  
    return z * y 4 (CP)  
    z << 2  
}
```

Strength reduction

Constant folding (CF)

Arith simpl

Another example

```
x := a + b;
```

```
...
```

```
y := a + b;
```

Another example

```
x := a + b;
```

```
...
```

```
y := a + b; X
```

} only if x, a, b not
modified!

Another example

```
if (...) {  
    a := read();  
    x := a + b;  
    print(x);  
}
```

...

```
y := a + b;
```

Another example

```
if (...) {  
    a := read(); t := a + b  
    x := a + b; t  
    print(x);  
} else { t := a + b }
```

...

y := ~~a + b~~; t

Partial Redundancy
Elimination PRE

Another example

```
x := y  
...  
z := z + x
```

Another example

```
x := y  
...  
z := z + xy } x,y not modified  
copy prop
```

Another example

```
x := y  
...  
z := z + y
```

What if we run CSE now?

Another example

```
x := y  
...  
z := z + y X
```

What if we run CSE now?

Another example

x := **y**********z**

...

x := ...

Another example

~~x := y**z~~

...

x := ...

}

if x is not used

dead assignment elim
(unused assignment elim)

- Often used as a clean-up pass

x := y
z := z + x

Copy prop

x := y
z := z + y

DAE

~~x := y~~
z := z + y

Another example

```
if (false) {  
    ...  
}
```

Another example

```
if (false) {  
    ...  
}
```

dead code elim
(unreachable code elim)

Another common clean up opt

Another example

- In Java:

```
a = new int [10];
for (index = 0; index < 10; index++) {
    a[index] = 100;
}
```

Another example

- In “lowered” Java:

```
a = new int [10];
for (index = 0; index < 10; index++) {
    if (index < 0 || index >= a.length()) {
        throw OutOfBoundsException;
    }
    a[index] = 0;
}
```

Another example

- In “lowered” Java:

```
a = new int [10]; ①
for (index = 0; index < 10; index++) {
    if (index < 0 || index >= a.length()) {
        throw OutOfBoundsException;
    }
    a[index] = 0;
}
index ∈ {0..9} ← Range analysis
```

10 ← Kinda like CP
if we assume
stmt ① acts
like `a.length := 10`

10 ← Branch folding
+ unreachable
code claim

Another example

```
p := &x;  
*p := 5  
y := x + 1;
```

Another example

```
p := &x;  
X *p := 5  
y := x + 1; 6  
      5
```

pointer / alias analysis

```
x := 5;  
*p := 3  
y := x + 1; → ???
```

Another example

```
for j := 1 to N
    for i := 1 to M
        a[i] := a[i] + b[j]
```

Another example

```
for j := 1 to N          t := b[j]
    for i := 1 to M
        a[i] := a[i] + b[j] t
```

Loop invariant
Code motion

Another example

```
area(h,w) { return h * w }

h := . . . ;
w := 4 ;
a := area(h,w)
```

Another example

```
area(h,w) { return h * w }
```

```
h := ...;  
w := 4;  
a := area(h,w)  
h * w  
h * 4  
h << 2
```

Many "illy" opts become
important after inlining

Optimization themes

- Don't compute if you don't have to
 - unused assignment elimination
- Compute at compile-time if possible
 - constant folding, loop unrolling, inlining
- Compute it as few times as possible
 - CSE, PRE, PDE, loop invariant code motion
- Compute it as cheaply as possible
 - strength reduction
- Enable other optimizations
 - constant and copy prop, pointer analysis
- Compute it with as little code space as possible
 - unreachable code elimination
